Abstract
Objective: The aim of this study was to compare early maladaptive schemas and life styles in drug dependences and normal population to recognize their role in drug dependence. Due to their importance in interpretation of special situations, cognitive schemas and life styles have a significant role in cognitive theories. Methods: The method of this research were post-facto and sectional styles. The population were included of 100 drug dependence adults and 100 non-drug dependence who were selected by at-reach methods. Young early maladaptive schema-short form and Basic Adlerian scales for interpersonal success-adult form questionnaires were used. Findings: the results showed that there were significant differences between early maladaptive schemas and life styles in groups under research. Conclusion: the study showed that drug dependence people suffer from high levels of early maladaptive schemas and their life styles are maladaptive. As a result, in prediction of dependence to drug and in treating it too much attention must be given to cognitive factors. Keywords: drug dependence, schema, early maladaptive schema, life style
