

## The Comparison of Three Dimensions of Personality in Self Referred Addicted and Normal Men

Sarialghadam, Z.<sup>1</sup>, Alilou, M. M.<sup>2</sup>

### Abstract

**Aims:** This research was aimed to compare the three dimensions of personality in self referred addicted men and normal one. **Method:** The research design was causal-effect research method and 30 self referred addicted men selected by available sampling, and 30 normal men (non-addicted) who were matched on sex, age, marital status, and level of education were selected. **Results:** The results showed that the addicted men were scored higher on neurotic but there were not any significant differences on two other dimensions of personality. **Conclusion:** These results can have applied implications in clinics.

**Keywords:** Extroversion, Neurotic, Psychosis, Substance Dependency
