Abstract

Introduction: Addiction Phenomenon among detoxified people is an important therapeutic problem for substance abusers. The aim of this research was the study of effectiveness of transactional behavior analytic group therapy on prevention of relapse of detoxified people.

Method: The research design was quasi experimental with witness group. By using of available sampling of detoxified people who referred to government centers for maintenance therapy with Methadone, 24 subjects that divided to two control and witness groups (12 subjects for each group) selected of Bojnord city. Each subjects completed the write's relapse prediction scale as pretest. Post test administered after group therapy and after 5 months follow up test administered among two groups. Morphine test has done with follow up test simultaneously. Independent samples t-test and covariance analysis has run for analyzing of data.

Results: The results of covariance showed that tempting of substance use was significantly differed in post test and follow up, but there was not significant difference in probability of substance use. Conclusion: Finding of this research showed, the transactional behavior analytic group therapy may be effective in tempting of substance use among detoxified people and it can considered by specialists.
