The Study of the Role of Contributor Factors in Addiction Withdrawal

Kianipour, O.¹; Pouzad, A.²

Abstract
Introduction: The present paper investigated the factors contributing to addiction withdrawal so as to it would be possible to set preventive and rehabilitative programs for addicts. Method: The study was ex-post facto and causal-comparative one. Population included all addicts referred to addiction withdrawal centers of Kahnouj city and the sample was selected of addicts of Yaran addiction withdrawal Center by voluntary sampling. Bar-on emotional intelligence inventory, family boundary questionnaire and demographic information were administered among selected sample. Results: The results showed that normal family boundaries, higher emotional intelligence and opium use in comparison of crack and crystal glass are effective on addiction withdrawal. But disengaged family boundaries, crack and crystal glass use can be led to addiction recursion. Age, addiction duration, marital status, and education level are not effective on addiction withdrawal. Conclusion: Altogether, the results represented the role and importance of variables namely: family, emotional intelligence, and the kind of used material in addiction withdrawal.

Keywords: Addiction Withdrawal, Family Boundary, Emotional Intelligence
