

Studying the relationship between the styles of attachment, drug addiction and psychological profile of addicts in comparison with non-addicts (in self-introduced centers of Bushehr Province)

Alireza Jazayeri, Ph.D. Mahmood Dehghani M.A.

Emphasizing on effective factors in drug dependency and multiple drug relapse, is probably related to formation of personality models. These models are heavily affected by development orientation personality. Various researches show that attachment as a development factor has a decisive role in forming personality models. Hence, in one hand, the present research evaluates the relationship between attachment styles and drug dependency and ,in the other hand, it addresses the relationship between attachment /drug addiction and psychological profile. The statistical community of this research consists of all male referrals to self-introduced centers in Bushehr province in summer ۱۳۸۱. The sample group consists ۱۰۰ individuals of this community and comparison group consists another ۱۰۰ individuals who had no history of drug abuse. They were controlled by counterpart variables. The tools of this research are MCMI-II and adults' attachment questionnaire. The satisfaction of validity and reliability of research literature are reported. Applied statistical methods include χ^2 statistical test and profile analysis. To compare the individual distribution based on attachment style, χ^2 test is obtained meaningfully in $P < 0.05$ level. Also, the results of profile analysis for evaluating the effect of drug addiction and attachment style on psychological profile is meaningful in $P < 0.05$ level. In summary, the research shows that there is a relationship between attachment style and drug addiction as well as between attachment/addiction and psychological profile.
